

FINAL DIAGNOSTIC SUMMARY:

1. VECTRA 1 RIGHT UPPER BACK, SHAVE: **MELANOMA IN-SITU** OF LENTIGINOUS TYPE; CLARK LEVEL 1; THE POSSIBILITY OF EARLY MICROINVASION TO A DEPTH OF 0.15mm CANNOT ABSOLUTELY BE EXCLUDED. SEE SUPPLEMENTARY REPORT BELOW.

2. VECTRA 20 MEDIAL LEFT FOREHEAD, SHAVE: **BENIGN STEATOCYSTOMA SIMPLEX.**

INTERIM DIAGNOSTIC SUMMARY:

1. VECTRA 1 RIGHT UPPER BACK, SHAVE: **MELANOMA IN-SITU** OF PROBABLE LENTIGINOUS TYPE; CLARK LEVEL 1, ARISING IN ASSOCIATION WITH A DYSPLASTIC COMPOUND NAEVUS; CONFIRMATORY IMMUNOHISTOCHEMISTRY TO FOLLOW. CLEARANCE 1MM AT TRANSVERSE; 0.25MM AT DEEP EDGE.

2. VECTRA 20 MEDIAL LEFT FOREHEAD, SHAVE: **BENIGN STEATOCYSTOMA SIMPLEX.**

Clinical Notes: Vectra 1 R upper back shave Bx dys/MM check margins; Vectra 20 Med L forehead Cyst Bx seb hyperplasia/O

Macroscopic:

1. Labelled '**Vectra 1 R upper back**'. A 10 x 9 x 1mm shaved skin specimen with a variegated brown grey lesion 7 x 6mm. 1A 4TS in total.

2. Labelled '**Vectra 20 Med L forehead**'. A 5 x 3 x 1mm shaved skin specimen with a grey roughened surface. Further fragments also present. 2A 2TS in total with associated fragments.

Microscopic:

1. Vectra 1 Right upper back, shave: Sections show changes favouring melanoma in-situ of lentiginous type; Clark level 1, arising over a pre-existing severely dysplastic compound naevus. No definite dermal invasion is identified. Only occasional cells are seen in the dermis which appear to mature with descent. The junctional component is nested and lentiginous and also exhibits focal pagetoid scatter. The changes have a 1mm clearance at the transverse margins and a 0.25mm clearance at the deep edge. Confirmatory immunohistochemistry will follow.

2. Vectra 20 Medial left forehead, shave: Sections show the top of a cystic structure with features favouring a solitary benign steatocystoma. The cyst is lined by attenuated bland appearing epithelium with an undulating eosinophilic cuticle. The lesion extends through the base of the specimen.
